

How many triangles can you create inside each of these polygons using only the existing vertices, WITHOUT any of the lines intersecting?

How many of these triangles can you create inside a polygon with 10 sides?

How many of these triangles can you create inside a polygon with 60 sides?

How many of these triangles can you create inside a polygon with ANY number sides?

How could you use this information to find the SUM of the INTERIOR ANGLES in a polygon with ANY number of sides?

Polygon	Number of Sides	Number of Triangles	Sum of the Interior Angles
Triangle	3 - 2	1 $\times 180$	180°
Quadrilateral	4 - 2	2 $\times 180$	360°
Pentagon	5 - 2	3 $\times 180$	540°
Hexagon	6 - 2	4 $\times 180$	720°
Heptagon	7 - 2	5	900°
Octagon	8	6	1080°
Nonagon	9	7	1260°
Decagon	10	8	1440°

On the grid below, plot the relationship between the number of sides and the sum of the interior angles.

$$\text{Slope} = 180$$

$$y\text{-int} = -360$$

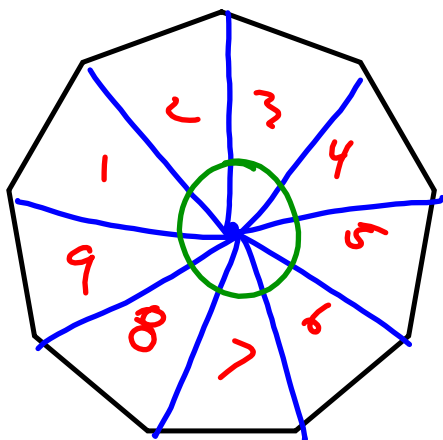

Use your graph to create a rule to determine the sum of the interior angles for a polygon with n sides.

$$y = 180x - 360$$

$$\text{Angle} = (n - 2) \times 180$$

$$= \underline{180n - 360}$$

$$\begin{array}{l} 2(x+5) \\ 2x+10 \end{array}$$

Shape
= 9 sides

9 triangles
- 360 middle

$$\text{Sum} = n(180) - 360$$

On the grid below, plot the relationship between the number of sides and the sum of the interior angles.

Use your graph to create a rule to determine the sum of the interior angles for a polygon with n sides.

Polygon Practice

1. Draw as many non-intersection diagonals as possible to create non-overlapping triangles. What is the sum of the interior angles in each case?

360°

720°

540°

1260°

2. Polygon A is a regular 10-gon and polygon B is an irregular 10-gon. Are the sums of their interior angles equal? Explain.

3. What is the measure of each interior angle of a regular 14-gon?

$$(14-2) \times 180 = \frac{2160}{14}$$

EACH ANGLE
= 154°

4. The sum of the interior angles in a polygon is 1440. How many sides does the polygon have?

$$\text{Sum} = (n-2) \times 180$$

$$1440 = (n-2) \times 180$$

$$1440 = 180n - 360$$

⋮

$$10 = n$$

$$\text{Sum} = 180n - 360$$

$$1440 = 180n - 360$$

+360

$$\frac{1860}{180} = \frac{180n}{180}$$

$$10 = n$$
